Allen Patented Magnetic Holster Retention System has Rendered Traditional Snap Formats Obsolete

10/18/17: For Immediate Release

(Broomfield, CO.) Holsters for personal carry sidearms have two basic requirements; 1) they must allow you to draw your weapon quickly, 2) they need to store your weapon securely & safely when not being used. The new Swipe™ MQR Holster from Allen Company® combines both of those attributes using their patented Magnetic Sliding Retention System in a way never seen before.

Hip holsters typically employ a snap-system for their retention band. Anyone that has used one of these, knows that they can be hard to break loose and cumbersome to manage.

The Swipe MQR Holster uses a patented magnetic system that releases in 50% less time than a traditional snap and locks quickly uses a scientifically designed magnetic locking system. To use-simply clear the lock using a fast directional "swipe" motion to break the magnetic bond. Locking is even easier. To lock-hold the retention band head near the magnetic base and the polarity will draw and lock the two points together. This bond creates a locking force that can only be reversed from one direction so your weapon can't be removed by other persons.

Swipe MQR is a retention system that is lightning fast and structurally more reliable than a standard snap system.

Swipe MQR Retention System Holsters Are Available in 18 of the Most Popular Handguns Including:

- Single and Double-Action Revolvers
- Extra Large Frame Revolvers with Full Lugs
- Sub Compact Semi-Auto
- Compact Semi-Auto
- Full Size Semi-Auto
